

How FuelCloud Benefits Wine Makers

Who is FuelCloud?

FuelCloud is a fuel technology company that builds fuel management systems designed for the future of business. The platform combines flexible, light-weight hardware with powerful cloud-based software that gives managers the data they need to make better decisions about their fuel.

Automates tax refunds: FuelCloud automates the completion of federal and state fuel tax refunds for off-road fuel use. California's state fuel taxes are among the highest in the US — wineries could be recouping thousands of dollars if they're not already filing tax refunds, or take the pain out of completing the refunds they do every year.

Save money, simplify reporting, and take control of your fuel

Decrease fuel slippage: FuelCloud's hardware is easy to install on any tank, so fuel managers can protect their most remote tanks from theft and detect leaks or inventory discrepancies faster.

Easily manage seasonal fuel access: Do more drivers need fuel access for just a few weeks during harvest? Add, edit, or remove fuel access for drivers and vehicles with a few clicks on FuelCloud's web portal, available on any internet-connected device. You can even activate or deactivate tanks on a month-by-month basis to get FMS when you need it.

Are you ready for the future of fuel management with FuelCloud?

Northwest Pump can help take control of your fuel and get FuelCloud into the wine industry.
